SANDEEP R N

Site Reliability Engineer | DevOps Engineer

sandeeprn1998@gmail.com | +91 9880589997 | linkedin.com/in/sandeep-rn | sandeeprn.in | Bengaluru, India

PROFESSIONAL SUMMARY

Site Reliability / DevOps Engineer with 3.5+ years of experience driving reliability, observability, and toil elimination across large-scale multi-cloud environments (AWS, Azure, OCI). Built SLI measurement infrastructure tracking a customer-committed 99.95% uptime SLO across 15k+ URL, synthetic, and service checks — reducing false-positive alert noise through precision trigger engineering. Automated 15+ hrs/wk of operational toil and led production incident response with structured RCA and runbook authoring. Skilled in Zabbix, Grafana, Python, and Ansible. Holds AZ-400 DevOps Engineer Expert, AZ-104, and OCI Foundations certifications. Actively leverages AI-assisted tooling (Claude, GitHub Copilot) to accelerate automation development and incident diagnostics.

TECHNICAL SKILLS

Observability & Monitoring: Zabbix (SLI tracking, synthetic monitoring, 15k+ checks), Grafana, Azure Monitor, Centreon, Prometheus, JMX APM

SLO & Reliability Engineering: false-positive reduction, error budget tracking, capacity management, toil reduction, MTTD & MTTR optimisation

Incident Management: PagerDuty, on-call rotation, RCA authoring, runbooks creation & maintenance, production bridge facilitation, postmortem reviews, MTTD & MTTR reduction

Toil Elimination & Automation: Python (Zabbix API, OCI SDK), Bash, Ansible (fleet-scale config management and agent deployment)

Infrastructure-as-Code: Terraform (AWS EKS, VPC, remote state), Ansible

Cloud Platforms: AWS (EC2, S3, IAM, CloudWatch, EKS), Azure (AZ-104, AZ-400), OCI

Containers & Orchestration: Docker, Kubernetes, Amazon EKS

CI/CD & Release: Azure DevOps Pipelines, Github Actions

Networking: VPC, VPN, load balancing, DNS, firewall (iptables), security groups, network peering, NAT

AI Tools: GitHub Copilot, Claude, Cursor — used daily for automation script development, runbook drafting, alert triage acceleration and operational efficiency improvements

PROFESSIONAL EXPERIENCE

SymphonyAI | (Payroll: Aadit Technologies) *Bengaluru, India*

Senior Site Reliability / Cloud Engineer *Apr 2026 – Present*

- **DR Reliability & RTO/RPO Improvement:** Designed OCI Disaster Recovery Protection Groups for a Tier-1 customer — replaced legacy backup-based DR with orchestrated failover/failback, measurably improving RTO/RPO and enabling repeatable DR drills with zero manual coordination overhead.
- **Toil Elimination — Fleet Automation:** Authored Ansible playbooks for Zabbix agent deployment, configuration standardization, and version upgrades across 1000+ Linux servers — reducing per-server onboarding toil from ~30 min to under 2 min.
- **Production Incident Response & RCA:** Led real-time on-call bridge calls with enterprise customers — structured cross-team triage, drove MTTR reduction through systematic fault isolation, and produced detailed postmortem RCA reports, and maintained operational runbooks and escalation procedures for high-severity incidents.
- **CI/CD Operational Awareness:** Supported Azure DevOps Pipeline workflows for patch automation and hotfix releases — familiar with pipeline architecture, stage gate logic, environment approvals, and post-deployment verification across multi-environment deployments.
- **Container Workload Stability:** Managed Docker-based application deployments across environments — container lifecycle management, image validation, rollback coordination, and service health verification.
- **Observability Platform Migration:** Led end-to-end Zabbix 4 → 7 upgrade across 1000+ servers and 15k+ checks — agent validation, template restructuring, dashboard overhaul, and inventory consolidation with zero monitoring blind spots during cutover.

SymphonyAI | (Payroll: Aadit Technologies) *Bengaluru, India*
Cloud Engineer *Mar 2023 – Mar 2026*

- **SLI/SLO Implementation — Availability Tracking:** Built SLI measurement infrastructure in Zabbix to track a customer-committed 99.95% uptime SLO across 15k+ URL and web checks — covering response code validation, latency thresholds, and no-data conditions to accurately reflect real availability.
- **Synthetic Monitoring & Transaction Checks:** Designed and deployed synthetic monitoring scripts on the Zabbix server to simulate end-user login flows and perform predefined UI/API operation checks — catching availability failures invisible to passive response-code monitoring.
- **Alert Signal Quality — False Positive Reduction:** Rewrote Zabbix trigger expressions to combine response code + no-data conditions, significantly reducing false-positive alert noise and improving MTTD accuracy — ensuring on-call load reflected genuine service degradation, not monitoring artefacts.
- **Toil Elimination — Python Automation:** Built Zabbix API automation suite for daily alert digests, monthly utilisation summaries, inventory sync, and maintenance reporting — eliminating 15+ hrs/wk of recurring manual operational work across multiple teams.
- **Infrastructure Reliability Operations:** Managed Azure and OCI Linux fleets — OS patching, performance troubleshooting, capacity monitoring, and environment validation across production and non-production estates to maintain uptime SLAs.

PROJECTS

SLO Monitoring Stack: Zabbix 4 → 7 Migration & Automation | *Python · Ansible · Zabbix API · Grafana · Synthetic Monitoring*

- Built and migrated a full SLI/SLO measurement platform across 1000+ servers and 15k+ URL, synthetic, and service checks — tracking a 99.95% uptime SLO. Engineered synthetic transaction monitors (login + operation flows) and rewrote trigger logic to eliminate false positives. Python automation suite eliminated 15+ hrs/wk of toil; Ansible playbooks cut per-server onboarding from 30 min to under 2 min (93% reduction).

OCI Cloud Cost Automation | *Python · OCI SDK · 20+ Compartments · 8 Regions*

- Automated detection and cleanup of unattached OCI volumes across 20+ customer compartments — identified $4,536/year in cloud waste invisible to manual review. Designed with dry-run mode and per-compartment safety gates to prevent accidental deletion in production tenancies.

E-Commerce DevOps on AWS EKS | *Terraform · EKS · ArgoCD · GitHub Actions · Route53 · Docker | Personal Project*

- End-to-end DevOps implementation for a multi-microservice e-commerce app: provisioned EKS cluster with Terraform (VPC, S3 remote state, DynamoDB locking), deployed Kubernetes workloads (Deployments, Services, Ingress + controller, PV/PVC, Storage Class), set up ArgoCD GitOps and GitHub Actions CI/CD, configured Route53 with custom domain pointing to EKS.

Docker Multi-Service App → Amazon ECR | *Docker · AWS ECR · Bash · Lifecycle Policies | Personal Project*

- Containerised a multi-service application; configured ECR repositories with image tagging strategy and lifecycle policies for automated stale-image cleanup. Scripted build-tag-push pipelines for dev → staging image promotion with validation gates.

CERTIFICATIONS

Microsoft Certified: DevOps Engineer Expert (AZ-400) — *Credential ID: 4790DEDAC422B797*
Microsoft Certified: Azure Administrator Associate (AZ-104) — *Credential ID: 8DA648914E6F9A0E*
Oracle Cloud Infrastructure 2025 Certified Foundations Associate — *Credential ID: 102961170OCI25FNDCFA*

EDUCATION

Master of Computer Applications (MCA) – Bangalore University — *2019 – 2022*
Bachelor of Computer Applications (BCA) – Bangalore University — *2016 – 2019*
